ButtonEvents ReflectionLog

(CSE2920 – Events) – Stefan Such

How has your program changed from planning to coding to now? Explain.

This program was easier to write than most of the other tutorial lessons. It would have been nice to know how events work when I was making that thermostat (you probably saw the jank I had to deal with when using polling rates)

A method inside of the main method (written entirely inside of a passed value sent to another method too!) was a little weird to wrap my brain around, but it's not terribly complicated.

```
redButton.addStateChangeListener(new DigitalInputStateChangeListener() {
    public void onStateChange(DigitalInputStateChangeEvent e) {
        System.out.println("State: " + e.getState());
    }
});
```
